                                              Question 1
                                                                  A set of N numbers (separated by one space) is passed as input to the program. The program must identify the count of numbers where the
                                              Correct
                                                                  number is odd number.
                                              Marked out of
                                              3.00
                                                                  Input Format:
                                              Flag question
                                                                  The first line will contain the N numbers separated by one space.
                                                                  Boundary Conditions:
                                                                  3 <= N <= 50
                                                                  The value of the numbers can be from -99999999 to 99999999
                                                                  Output Format:
                                                                  The count of numbers where the numbers are odd numbers.
                                                                  Example Input / Output 1:
                                                                  Input:
                                                                  5 10 15 20 25 30 35 40 45 50
                                                                  Output:
                                                                  5
                                                                  Explanation:
                                                                  The numbers meeting the criteria are 5, 15, 25, 35, 45.
                                                                  Answer: (penalty regime: 0 %)
                                                                        #include<stdio.h>
                                                                         int main()
                                                                      2
                                                                      3 v
                                                                         int num, odd=0;
                                                                         while(scanf("%d",&num)>0)
                                                                      6
                                                                         if (num%2==1)

                                              Question 2
                                                                  Given a number N, return true if and only if it is a confusing number, which satisfies the following condition:
                                              Correct
                                              Marked out of
                                              5.00
                                                                  We can rotate digits by 180 degrees to form new digits. When 0, 1, 6, 8, 9 are rotated 180 degrees, they become 0, 1, 9, 8, 6 respectively.
                                                                  When 2, 3, 4, 5 and 7 are rotated 180 degrees, they become invalid. A confusing number is a number that when rotated 180 degrees becomes
                                              Flag question
                                                                  a different number with each digit valid.
                                                                  Example 1:
                                                                  6->9
                                                                  Input: 6
                                                                  Output: true
                                                                  Explanation:
                                                                  We get 9 after rotating 6, 9 is a valid number and 9!=6.
                                                                  Example 2:
                                                                  89 -> 68
                                                                  Input: 89
                                                                  Output: true
                                                                  Explanation:
                                                                  We get 68 after rotating 89, 86 is a valid number and 86!=89.
                                                                  Example 3:
                                                                  11 -> 11
                                                                  Input: 11
                                                                  Output: false
                                                                  Explanation:
                                                                  We get 11 after rotating 11, 11 is a valid number but the value remains the same, thus 11 is not a confusing number.
                                                                  Note:
                                                                  1. 0 <= N <= 10^9
                                                                  2. After the rotation we can ignore leading zeros, for example if after rotation we have 0008 then this number is considered as just 8.
                                                                  Answer: (penalty regime: 0 %)
                                                                      1 #include<stdio.h>
                                                                      2
                                                                         int main()
                                                                      3 v
                                                                              int a,rem,flag=0,c=0,s=0,b;
                                                                      4
                                                                      5
                                                                              scanf("%d",&a);
                                                                              b=a;
                                                                      6
                                                                      7
                                                                              while(a)
                                                                      8
                                                                      9
                                                                                  rem = a\%10;
                                                                                  if(rem == 1 || rem == 6 || rem == 8 || rem == 9 || rem == 0)
                                                                     10
                                                                     11
                                                                                  flag ++;
                                                                     12
                                                                                  s = s*10 + rem;
                                                                     13
                                                                                  a = a/10;
                                                                     14
                                                                                  C++;
                                                                     15
                                                                              if (flag == c)
                                                                     16
                                                                     17
                                                                                  if (s!=b || c==1)
                                                                     18
                                                                     19
                                                                                       printf("true");
                                                                     20
                                                                     21
                                                                     22
                                                                     23
                                                                              else
                                                                     24
                                                                                  printf("false");
                                                                     25
                                                                     26
                                                                     27
                                                                              return 0;
                                                                     28
                                                                     29 }
                                                                         Input Expected Got
                                                                                            true
                                                                         89
                                                                                true
                                                                                            true
                                                                        25

                                                                                            false 🗸
                                                                   Passed all tests! <
                                              Question 3
                                                                  A nutritionist is labeling all the best power foods in the market. Every food item arranged in a single line, will have a value beginning from 1
                                              Correct
                                                                  and increasing by 1 for each, until all items have a value associated with them. An item's value is the same as the number of macronutrients it
                                              Marked out of
                                                                  has. For example, food item with value 1 has 1 macronutrient, food item with value 2 has 2 macronutrients, and incrementing in this fashion.
                                              7.00
                                              F Flag question
                                                                  The nutritionist has to recommend the best combination to patients, i.e. maximum total of macronutrients. However, the nutritionist must
                                                                  avoid prescribing a particular sum of macronutrients (an 'unhealthy' number), and this sum is known. The nutritionist chooses food items in
                                                                  the increasing order of their value. Compute the highest total of macronutrients that can be prescribed to a patient, without the sum
                                                                  matching the given 'unhealthy' number.
                                                                  Here's an illustration:
                                                                  Given 4 food items (hence value: 1,2,3 and 4), and the unhealthy sum being 6 macronutrients, on choosing items 1, 2, 3 -> the sum is 6, which
                                                                  matches the 'unhealthy' sum. Hence, one of the three needs to be skipped. Thus, the best combination is from among:
                                                                       2 + 3 + 4 = 9
                                                                       1 + 3 + 4 = 8
                                                                       1 + 2 + 4 = 7
                                                                  Since 2 + 3 + 4 = 9, allows for maximum number of macronutrients, 9 is the right answer.
                                                                  Complete the code in the editor below. It must return an integer that represents the maximum total of macronutrients, modulo 1000000007
                                                                  (10^9 + 7).
                                                                  It has the following:
                                                                    n: an integer that denotes the number of food items
                                                                    k: an integer that denotes the unhealthy number
                                                                  Constraints
                                                                      1 \le n \le 2 \times 10^9
                                                                       1 \le k \le 4 \times 10^{15}
                                                                  Input Format For Custom Testing
                                                                  The first line contains an integer, n, that denotes the number of food items.
                                                                  The second line contains an integer, k, that denotes the unhealthy number.
                                                                  Sample Input 0
                                                                  2
                                                                  2
                                                                  Sample Output 0
                                                                 3
                                                                  Explanation 0
                                                                  The following sequence of n = 2 food items:
                                                                  1. Item 1 has 1 macronutrients.
                                                                  2. 1 + 2 = 3; observe that this is the max total, and having avoided having exactly k = 2 macronutrients.
                                                                  Sample Input 1
                                                                 2
                                                                  1
                                                                  Sample Output 1
                                                                  2
                                                                  Explanation 1
                                                                  1. Cannot use item 1 because k = 1 and sum \equiv k has to be avoided at any time.
                                                                 2. Hence, max total is achieved by sum = 0 + 2 = 2.
                                                                  Sample Case 2
                                                                  Sample Input For Custom Testing
                                                                  Sample Input 2
                                                                 3
                                                                  Sample Output 2
                                                                  5
                                                                  Explanation 2
                                                                  2 + 3 = 5, is the best case for maximum nutrients.
                                                                  Answer: (penalty regime: 0 %)
                                                                        #include<stdio.h>
                                                                         int main()
                                                                      2
                                                                      3 ₹ {
                                                                      4
                                                                              long long n,k,sum;
                                                                      5
                                                                              scanf("%11d %11d",&n,&k);
                                                                              sum=0;
                                                                              for(long long i=1;i<=n;i++)</pre>
                                                                      7
                                                                      8
                                                                                  sum+=i;
                                                                                  if (sum == k)
                                                                     10
                                                                     11 ,
                                                                     12
                                                                                       sum-=1;
                                                                     13
                                                                     14
